

METHOD AND APPARATUS FOR FAST
NATURAL LOG(x) CALCULATION

ABSTRACT OF THE DISCLOSURE

Sub
A1
5 The present invention is, in one embodiment, a method for computing a natural logarithm function that includes steps of: partitioning a mantissa region between 1 and 2 into N equally spaced sub-regions; precomputing centerpoints a_i , of each of the N equally spaced sub-regions, where $i=0, \dots, N-1$; selecting N sufficiently large so that, within each sub-region, a first degree polynomial in m computes $\log(m)$ to within a preselected degree of accuracy for any m within the sub-region, where m is a mantissa of a binary floating point representation of a number; and computing a value of $\log(x)$ for a binary floating point representation of a particular number x stored in a memory of a computing device utilizing the first degree polynomial in m .

10 This embodiment of the present invention and others described herein reduce the complexity of approximations used to calculate natural logarithms while achieving numerical accuracy consistent with IEEE floating point precision.
